### Question 1 | Correct Mark 1.00 out of 1.00 [Flag question](#)

Convert the following algorithm into a program and find its time complexity using the counter method.

```
void function (int n)
{
    int i= 1;

    int s =1;

    while(s <= n)
    {
        i++;
        s += i;
    }
}
```

**Note:** No need of counter increment for declarations and scanf() and count variable printf() statements.

**Input:**

A positive Integer n

**Output:**

Print the value of the counter variable

**For example:**

Input	Result
9	12

**Answer:** (penalty regime: 0 %)

### Problem Statement

Given an array of 1s and 0s this has all 1s first followed by all 0s. Aim is to find the number of 0s. Write a program using Divide and Conquer to Count the number of zeroes in the given array.

#### Input Format

First Line Contains Integer m – Size of array

Next m lines Contains m numbers – Elements of an array

#### Output Format

First Line Contains Integer – Number of zeroes present in the given array.

**Answer:** (penalty regime: 0 %)

**Question 1** | Correct Mark 1.00 out of 1.00 

Given an array `nums` of size `n`, return *the majority element*.

The majority element is the element that appears more than  $\lfloor n / 2 \rfloor$  times. You may assume that the majority element always exists in the array.

**Example 1:**

**Input:** `nums = [3,2,3]`

**Output:** 3

**Example 2:**

**Input:** `nums = [2,2,1,1,1,2,2]`

**Output:** 2

**Constraints:**

- `n == nums.length`
- `1 <= n <= 5 * 10^4`
- `-2^{31} <= nums[i] <= 2^{31} - 1`

**For example:**

Time taken	1 day 21 hours
Marks	1.00/1.00

### Question 1 | Correct Mark 1.00 out of 1.00 Flag question

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child  $i$  has a greed factor  $g[i]$ , which is the minimum size of a cookie that the child will be content with; and each cookie  $j$  has a size  $s[j]$ . If  $s[j] \geq g[i]$ , we can assign the cookie  $j$  to the child  $i$ , and the child  $i$  will be content. Your goal is to maximize the number of your content children and output the maximum number.

#### Example 1:

##### Input:

```
3
1 2 3
2
1 1
```

##### Output:

```
1
```

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

##### Constraints:

```
1 <= g.length <= 3 * 10^4
```

```
0 <= s.length <= 3 * 10^4
```

```
1 <= g[i], s[j] <= 2^31 - 1
```

#### Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(){
3     int a;
4     scanf("%d",&a);
5     int ar[a];
6     int g;

A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a distance to burn out his calories.

If he has eaten  $i$  burgers with  $c$  calories each, then he has to run at least  $3^i * c$  kilometers to burn out the calories. For example, if he ate 3

burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are  $(3^0 * 1) + (3^1 * 3) + (3^2 * 2) = 1 + 9 + 18 = 28$ .

But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum distance

he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm. Apply greedy approach to solve the problem.

**Input Format**

First Line contains the number of burgers

Second line contains calories of each burger which is  $n$  space-separate integers

**Output Format**

Print: Minimum number of kilometers needed to run to burn out the calories

### Playing with Chessboard:

Ram is given with an  $n \times n$  chessboard with each cell with a monetary value. Ram stands at the (0,0), that is the position of the top left white rook. He is given a task to reach the bottom right black rook position ( $n-1, n-1$ ) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

#### Example:

##### Input

```
3
1 2 4
2 3 4
8 7 1
```

##### Output:

```
19
```

#### Explanation:

Totally there will be 6 paths among that the optimal is

Optimal path value:  $1+2+8+7+1=19$

#### Input Format

First Line contains the integer  $n$

The next  $n$  lines contain the  $n \times n$  chessboard values

#### Output Format

Print Maximum monetary value of the path

**Answer:** (penalty regime: 0 %)

- The first line contains T, the number of test cases. Following T lines contain:
  - Line 1 contains N1, followed by N1 integers of the first array
  - Line 2 contains N2, followed by N2 integers of the second array

Output Format

The intersection of the arrays in a single line

Example

Input:

1  
3 10 17 57  
6 2 7 10 15 57 246

Output:

10 57

Input:

1  
6 1 2 3 4 5 6  
2 1 6

Output:

1 6

For example:

Input	Result
1	10 57
3 10 17 57	
6	
2 7 10 15 57 246	

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(){
3     int n;
4     scanf("%d",&n);

## 4-Print Intersection of 2 sorted arrays-O(m+n)Time Complexity,O(1) Space Complexity

Started on	Wednesday, 29 October 2025, 9:17 PM
State	Finished
Completed on	Wednesday, 29 October 2025, 9:24 PM
Time taken	7 mins 15 secs
Marks	1.00/1.00
Grade	30.00 out of 30.00 (100%)

### Question 1 | Correct Mark 1.00 out of 1.00 ⚡ Flag question

Find the intersection of two sorted arrays.

OR in other words,

Given 2 sorted arrays, find all the elements which occur in both the arrays.

Input Format

- The first line contains T, the number of test cases. Following T lines contain:
  - Line 1 contains N1, followed by N1 integers of the first array
  - Line 2 contains N2, followed by N2 integers of the second array

Output Format

The intersection of the arrays in a single line

Example

Input:

1  
3 10 17 57  
6 2 7 10 15 57 246

Output:

10 57

Input:

1  
6 1 2 3 4 5 6  
2 1 6

Output:

1 6

For example:

Input	Result
1	10 57
3 10 17 57	
6	
2 7 10 15 57 246	

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(){
3     int a;
4     int e;
5     scanf("%d",&a);
6     for(int i=0;i<a;i++){
7         int b;
8         scanf("%d",&b);
9         int a1[b];
10    for(int i=0;i<b;i++){
11        scanf("%d",&e);
12        a1[i]=e;
13    }
14    int l;
15    int p;
16    scanf("%d",&l);
17    int a2[l];
18    for(int i=0;i<l;i++){
19        scanf("%d",&p);
20        a2[i]=p;
21    }
22    for(int i=0;i<b;i++){
23        for(int j=0;j<l;j++){
24            if(a1[i]==a2[j]){
25                printf("%d ",a1[i]);
26                break;
27            }
28        }
29    }
30 }
31 }

## 5-Pair with Difference-O( $n^2$ )Time Complexity,O(1) Space Complexity

Started on	Wednesday, 29 October 2025, 9:25 PM
State	Finished
Completed on	Wednesday, 29 October 2025, 9:34 PM
Time taken	8 mins 35 secs
Marks	1.00/1.00
Grade	4.00 out of 4.00 (100%)

**Question 1** | Correct Mark 1.00 out of 1.00 

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that  $A[j] - A[i] = k$ ,  $i \neq j$ .

Input Format:

First Line n - Number of elements in an array

Next n Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase:

YES as  $5 - 1 = 4$

So Return 1.

**For example:**

Input	Result
3	1
1 3 5	
4	

**Answer:** (penalty regime: 0 %)

```

1 #include<stdio.h>
2 int main(){
3     int n;
4     scanf("%d",&n);
5     int a[n];
6     int r;
7     int h=0;
8     for(int i=0;i<n;i++){
9         scanf("%d",&r);
10        a[i]=r;
11    }
12    int y;
